# E-MISSION POSSIBLE

Unlocking our low-emission future:

29 November 2017

## Motu Presentation

Catherine Leining on low-emission pathways

**Funders:**

# Topics

1. Mitigation needs
2. NZ's low-emission opportunities
3. Pathway risks
4. Implications for targets
5. Shaping the solution space

*Disclaimer: This presentation does not necessarily reflect the views of or endorsement by Low-Emission Future Dialogue participants, their organisations, or programme funders.*

# Bending the global curve

BASED ON ANNUAL GLOBAL TOTAL GREENHOUSE GAS EMISSIONS (GtCO<sub>2</sub>e)

Source: Adapted from UNEP Emissions Gap Report 2016, Climate Action Tracker and Climate Central

Source: Carbon Tracker Initiative et al. (2017). 2020: *The Climate Turning Point*. Mission 2020.

# We face a mitigation gap to 2030...

Source: MfE (2017). *The NZ ETS and New Zealand's Provisional Carbon Budget for 2021-2030*.

# ...and are not on track for 2050

Note that actual emissions and future targets are based on the 1990-2014 National GHG Inventory.

Source: Adapted from Vivid Economics (2017). *Net Zero in New Zealand*. Report commissioned by GLOBE-NZ.

# Climate policy framework

Past objective: Least-cost compliance with modest international responsibility targets

*= Incremental change*

New context: Joining global decarbonisation

*= Transformational change*

# LEF Dialogue process: Backcasting

Bold sector visions for zero net emissions

Sector characteristics supporting the vision:  
Balance will vary under different pathway choices

Sector milestones producing the characteristics:  
Technology, policy/regulation, business, behaviour

Sector actors and actions producing milestones:  
Who made change happen and how did they do it?

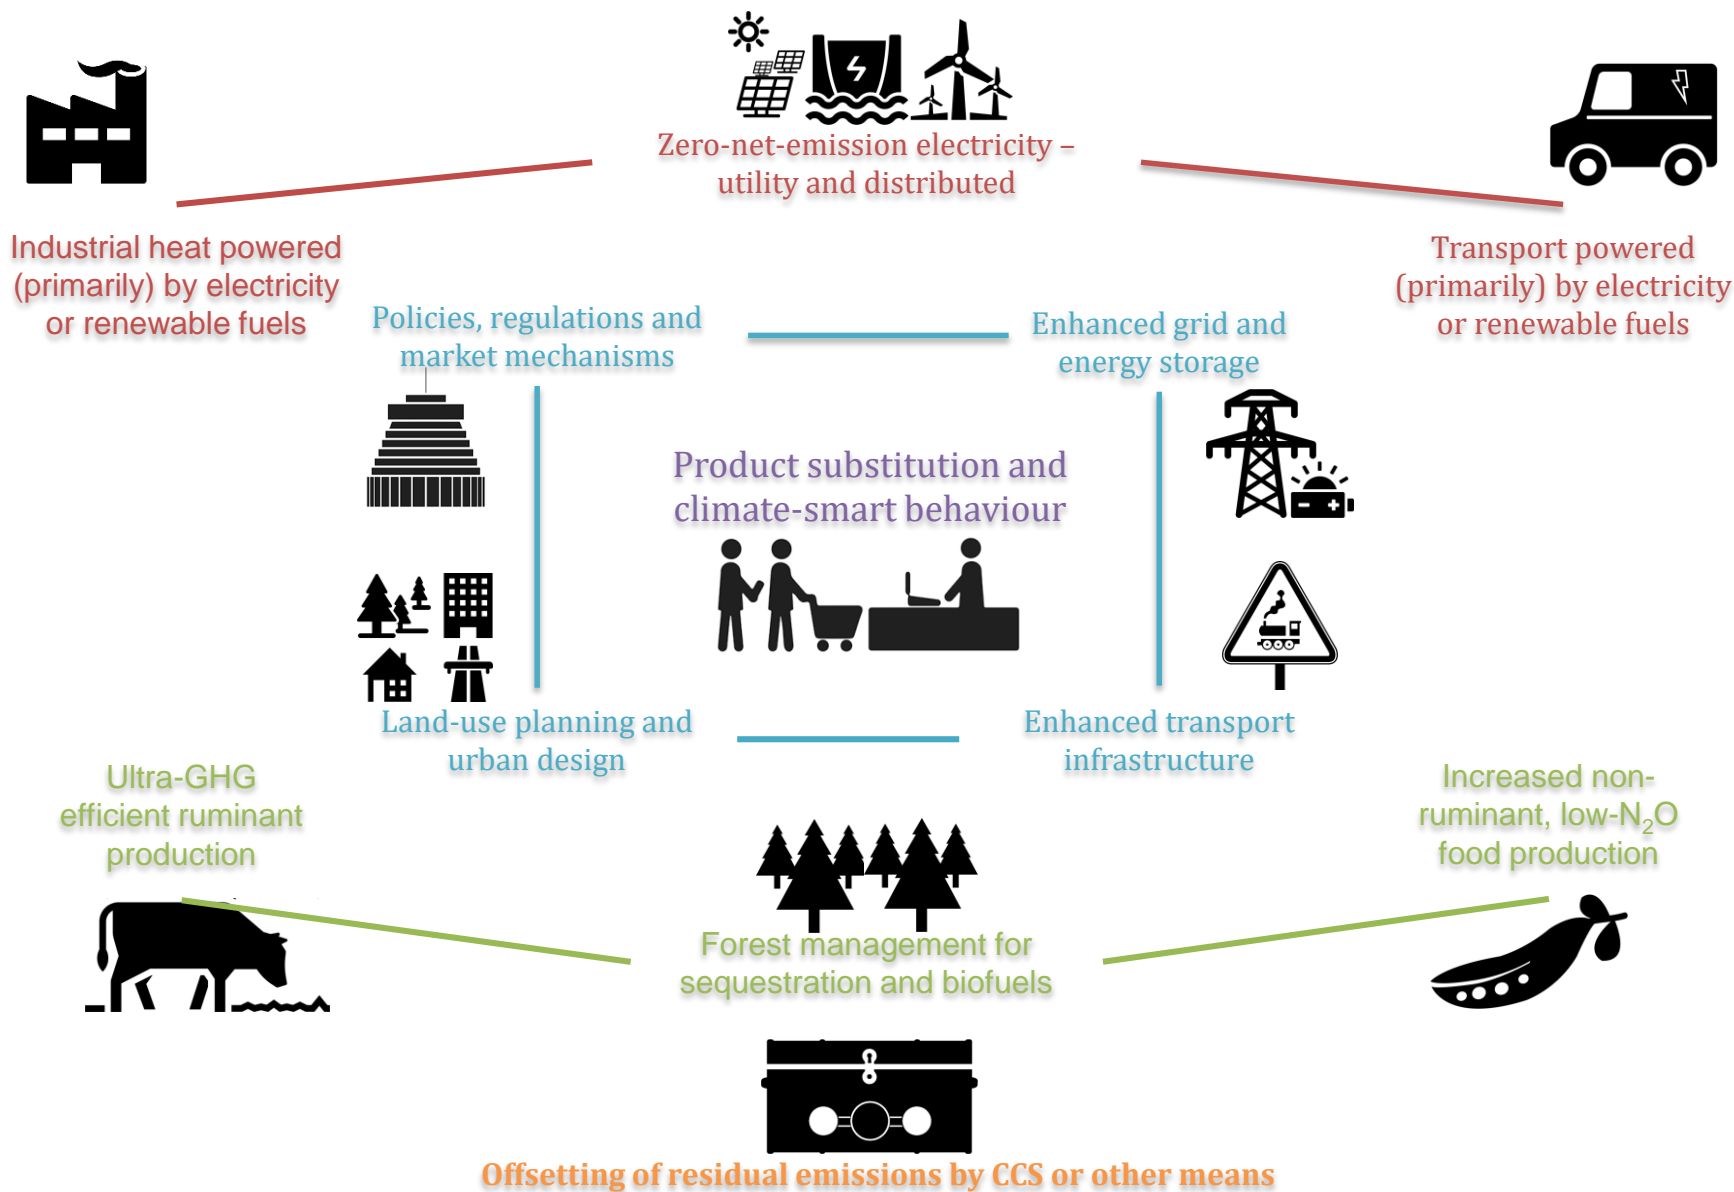

# A fresh climate narrative

New Zealand is responding to climate change with **smart solutions** that safeguard our future, enable a thriving low-emission economy, create new opportunities for our communities, and can be shared with other countries.

We are **accelerating this transition** by decarbonising our stationary energy and transport sectors, improving energy efficiency, making our agricultural production ultra-efficient, enhancing forest sinks, and strengthening partnerships across sectors.

# Driving a zero-net-emissions future

# Range of possible futures

**Stationary  
energy**

**Renewable electricity:**  
utility, distributed

**Industrial heat:**  
electric, renewable,  
hydrogen, disruptor

**Storage:**  
hydro lakes, batteries,  
hydrogen, disruptor

**Energy efficiency,  
conservation**

**Carbon capture  
and storage**

**Transport**

**Transport supply:**  
vehicle technology,  
networks, infrastructure

**Transport demand:**  
mode shift, urban planning,  
culture change, technology  
change, disruptor

**Transport energy:**  
electricity, biofuel,  
hydrogen, disruptor

**Food production:**  
ultra-GHG-efficient livestock,  
zero-CH<sub>4</sub>, low-N<sub>2</sub>O nutrition  
synthetic meat/milk

**Reduced food  
waste**

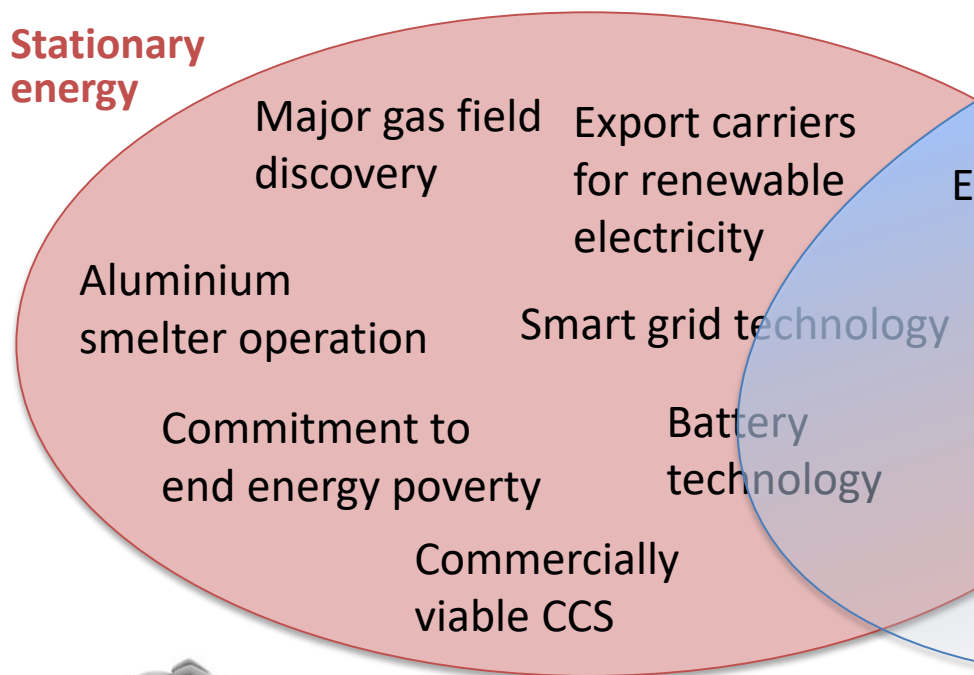

**Consumer demand for  
low-emission food**

**Agriculture**

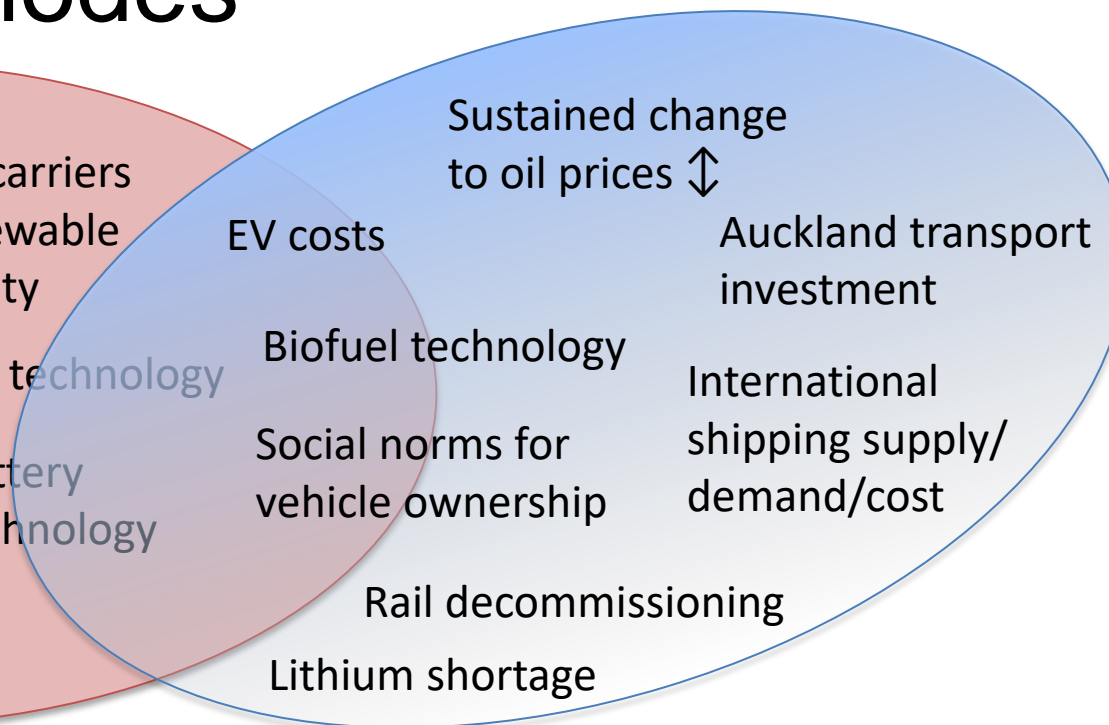

# Pivot points – nodes

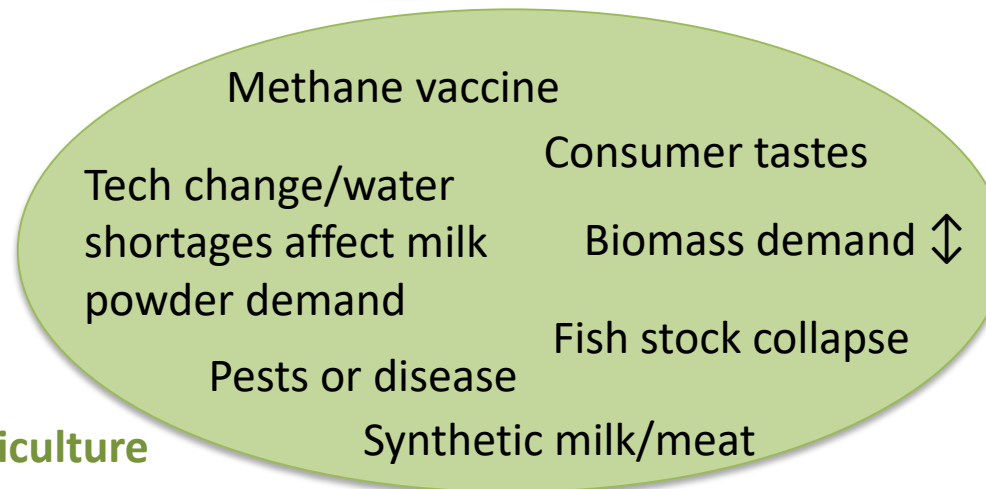

## Stationary energy

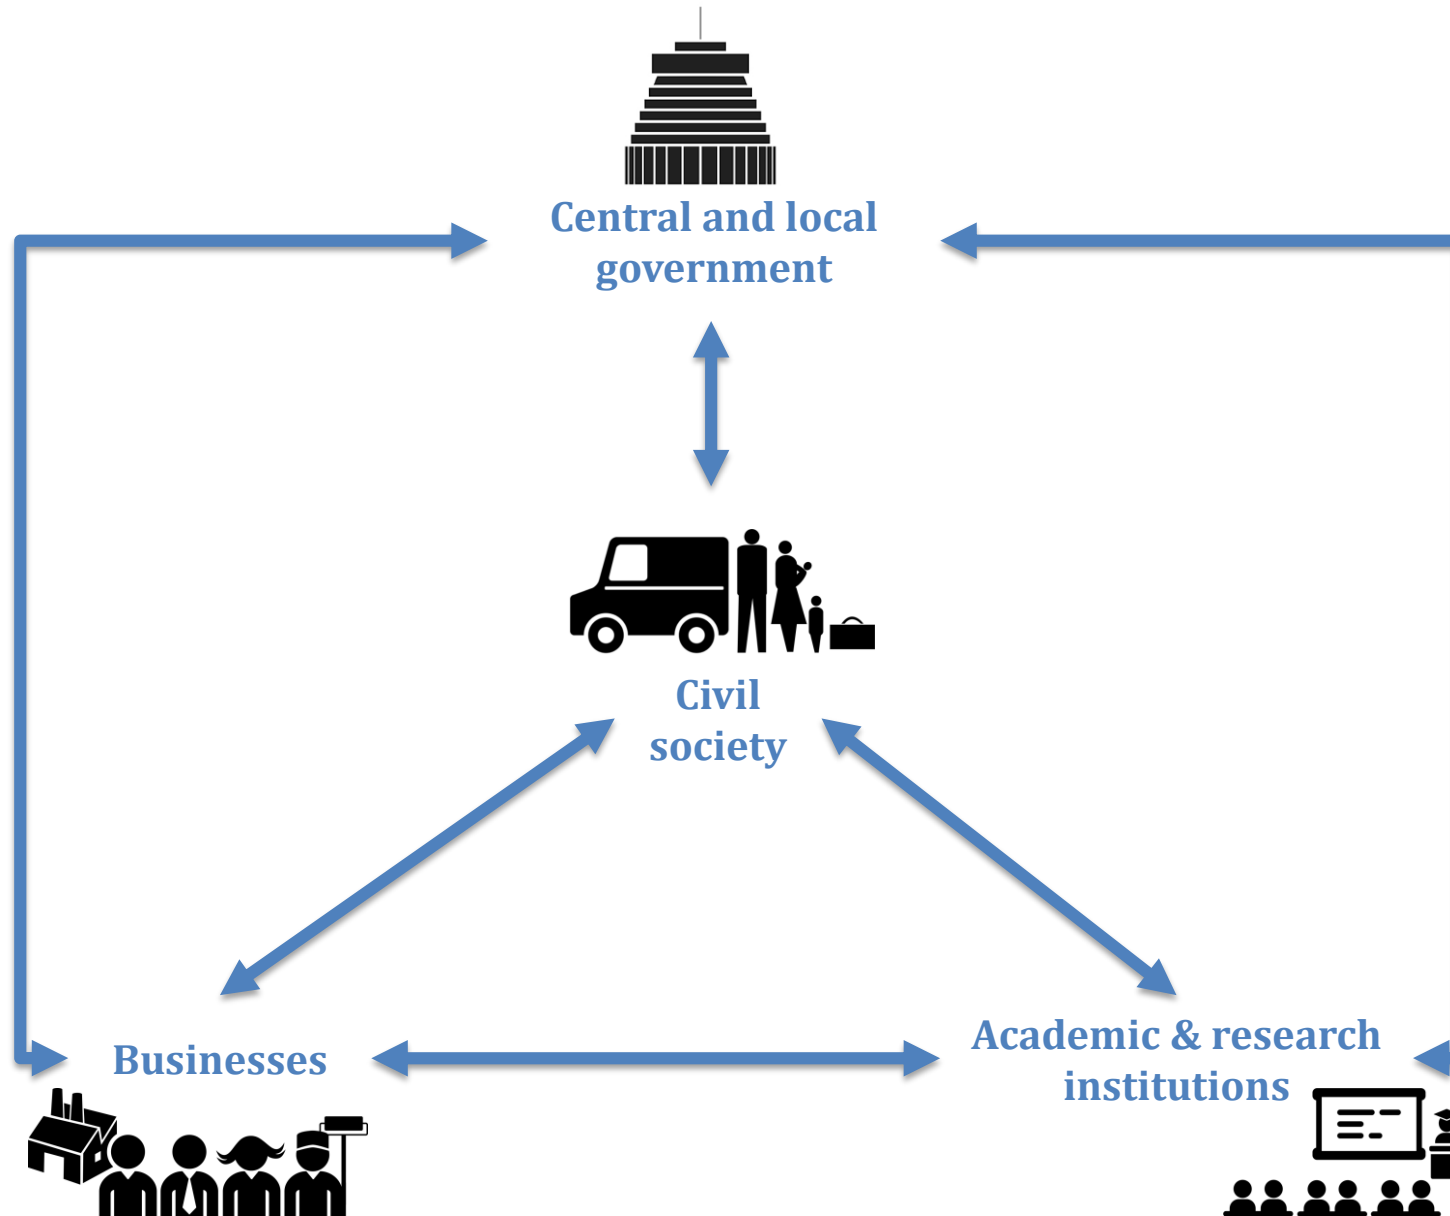

## Transport

## Agriculture

# Who will make change happen?

# Sample actions: Industrial heat

- Characteristic: Industrial heat (primarily) is produced with renewable electricity or other non-fossil fuels.
  - Milestone: All boilers are zero-emission
    - Actors and actions
      - Treasury develops policy and legislation for carbon-based fees for commissioning new fossil fuel boilers
      - Finance and Environment Ministers commission officials to calculate the social cost of carbon and ETS trajectories/scenarios
      - Treasury develops fee revenue recycling towards R&D activities
      - Treasury and Motu develop models for tax reform from variable ETS revenue
      - Industrial CEOs assess preferred zero-emission alternatives to industrial heat
      - Industrial CEOs investigate co-location of boilers with biomass and geothermal heat production
      - MBIE creates consortium of CRI and business to research zero emission alternatives to industrial heat
      - MBIE funds contestable research programme funds for low-emission industrial heat production
      - Consumer New Zealand demands higher environmental integrity from emissions-intensive industries
      - Consumer NZ advocates for GHG and water intensity labelling on food

# Pathway risks

## Moving too slowly

- Locking in high emissions

## Moving too quickly

- Locking out new innovations or generating perverse outcomes

## Disproportionate impacts on businesses and communities

## Uneven supply chain coordination

## Regulatory barriers and inconsistencies

## Politicisation of pathway options

## Uncertainty as an excuse for inaction

- Climate change science
- Global response and trade exposure
- Economic and social impacts of measures

# Implications for domestic targets

Targets without pathways are just numbers – and can be scary numbers

Pathway progress will not be linear and will be unpredictable

## Re-thinking targets

- Multiple dimensions/indicators across sectors – not just emissions per year
- Linkages to pathways, actions and actors
- Taking responsibility for NZ's whole footprint:
  - Cumulative emissions, consumption emissions, fossil fuel production for export and international transport
  - Important for business as well as government
- Evolution over time

# Shaping the solution space

1. Our destination is domestic decarbonisation, and any number of pathways could take us there.
2. This is not just about government; we need many kinds of actions by many kinds of actors.
3. Multidimensional targets can encourage more specific and ambitious actions.
4. We need to balance risks of action and risks of inaction under uncertainty.
5. An adaptive approach is supported by:
  - a. Building our capacity
  - b. Enabling experimentation
  - c. Leaving desirable options open
  - d. Avoiding lock-in to high-emission pathways.

# Where do we go next?

“In times of change,  
learners inherit the earth,  
while the learned find  
themselves beautifully  
equipped to deal with a  
world that no longer exists.”

Eric Hoffer

Social writer and philosopher

Key questions for the future:

- ❖ What is the case for accelerating domestic transformation?
- ❖ What actions are needed now to preserve desirable pathway options, and where can we be confident enough to start making choices?

# E-MISSION POSSIBLE

Unlocking our low-emission future:

29 November 2017

## Motu Presentation

**Suzi Kerr on models and institutions for adaptive  
decision making**

**Funders:**

# Models and institutions for adaptive decision-making

*Suzi Kerr, Motu Senior Fellow and Victoria University Adjunct Professor*

Unlocking our low-emission future  
Wellington, 29 November, 2017

# Transformational change under deep uncertainty

# Navigating toward a Net-Zero-Emissions Future

1. Investing over time under uncertainty  
delay, flexibility, options, adoption,  
adjustment costs
2. Modelling to inform decisions under  
uncertainty
3. Policy under uncertainty
4. Governance for social decision-making

# Transformation can take very different forms

Technology  
breakthrough

Social  
breakthrough

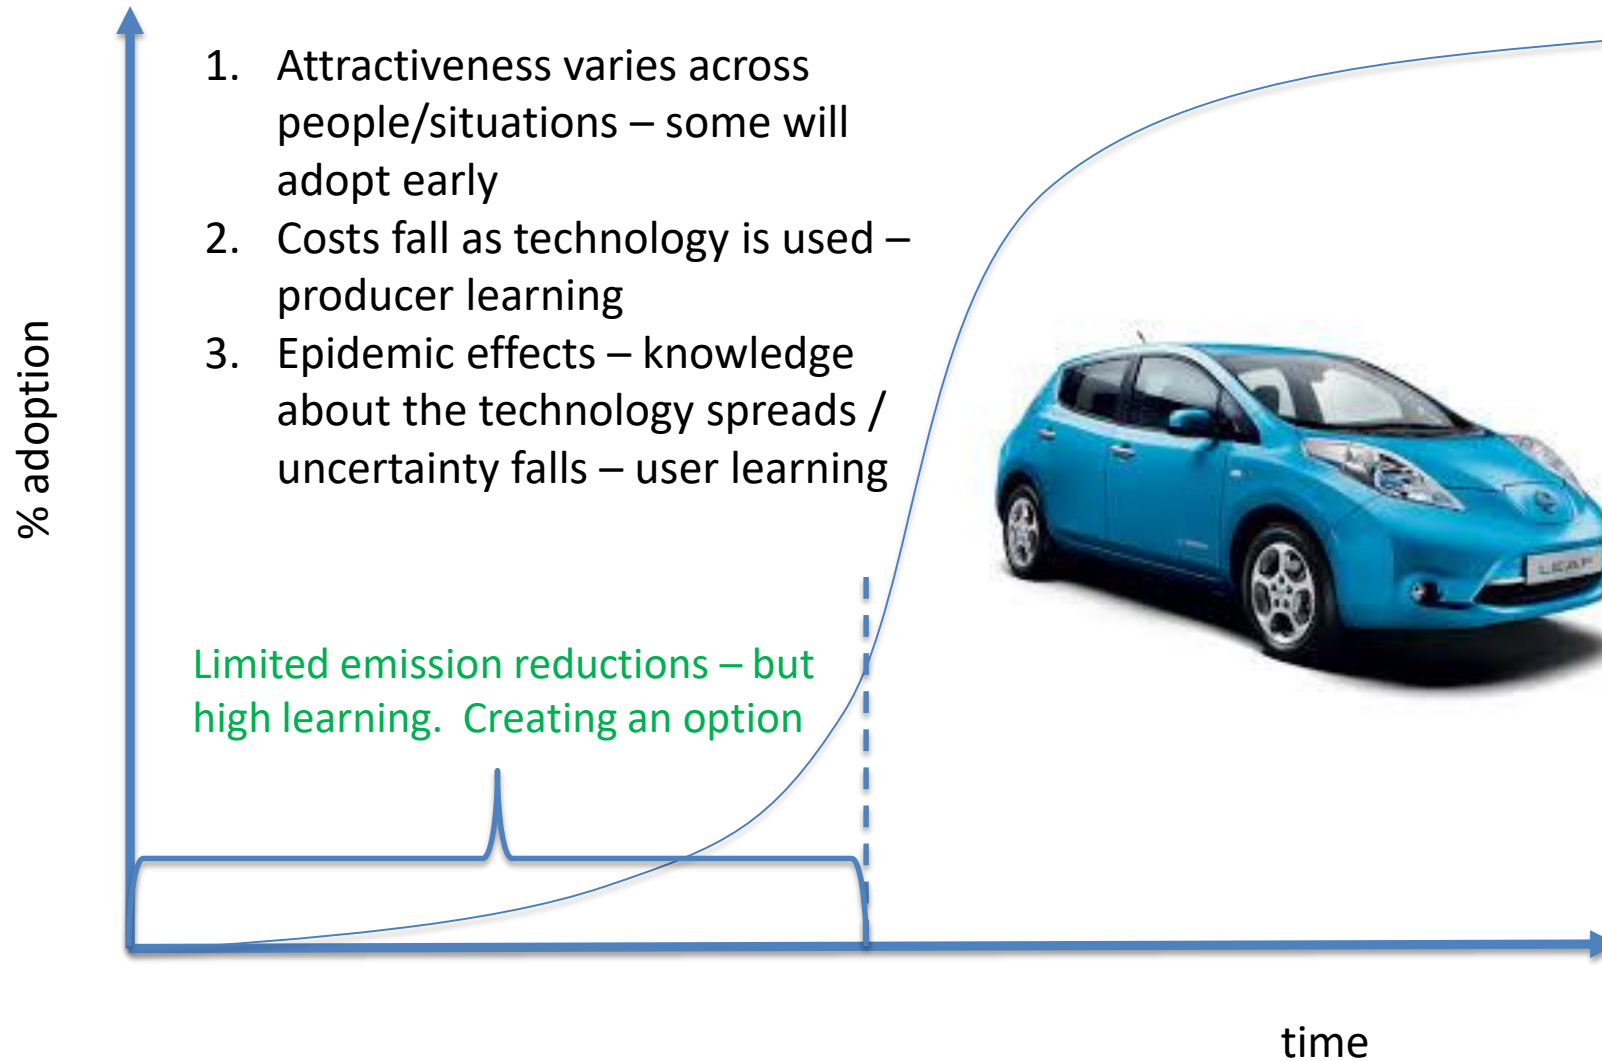

# How should we invest (or encourage investment) under uncertainty?

1. Delay investment (in green and brown technologies) if new information is likely to be revealed soon  
don't replace existing assets as early as you might
2. Invest in shorter-lived or more adaptable options
3. Focus on different type of investment - learning

# Adoption processes... and time

# Buying a real hydrogen transport option

Suppose we think with 99% certainty  
that electric is best for NZ passenger  
transport

Overconfidence effect?

# Convex costs of adjustment – it's hard to change fast

\$

Create options for faster  
action later, by beginning  
with lower cost options  
now

oats  
(*Avena sativa*)

MAC – 10  
years

MAC – 30  
years

Emission reductions

# Modelling under uncertainty

Crystal ball predictions 30 years out are of limited value

- For long-term modelling focus on understanding technical feasibility, sources of mitigation and timing of changes under current options

What should we be doing now to make sure these paths are possible?

Test performance of different short-term strategies under fundamentally different assumptions about technology, targets and prices

# Roles for government (under uncertainty)

## Target setting

- International
- Domestic – multi-faceted

## ETS settings

## Government's own low-emission investments

e.g. infrastructure, car fleet, buildings, education

## Support learning

### Research and development

- fundamental research where NZ could be a leader
- targeted research for adaptation to New Zealand

### Support for early adoption

## Coordination and facilitation (e.g. regulatory change) of new options implemented by private sector

## Engaging with Iwi around options in the Māori economy

## Phase out of old technologies – e.g. diesel vehicles

# Adaptive emissions pricing

Emissions pricing enables low-emission investments and activities to compete

An ETS can provide useful signals to investors and other actors about the value of mitigation at each point in time

Key decisions are cap and price bands – how fast do we push the NZ economy?

# Policy driven uncertainty: Policy stability and commitment

All government face incentives to free-ride internationally and to have inconsistent policy over time

Use financial instruments to give government a greater stake in higher emission prices and provide price protection to some key investors

Use strong governance structures to stabilise policy and support social decision making

# Supporting social decision-making

## Technical advice

- Clusters of research, modelling and policy development initiatives
- Climate change advisory body on technical and economic feasibility of targets, mitigation options and policies

## Agreement on goals and strategies

- Clusters of discussions on mitigation goals/strategies within and across sectors
- Large, centralised, representative cross-sector process to deliver consensus
- Political climate leaders group

## Collaboration on action

- Sector and cross-sector working groups focused on pathway finding, technical problem solving and cooperation
- Education and public awareness campaigns

# Ferry?

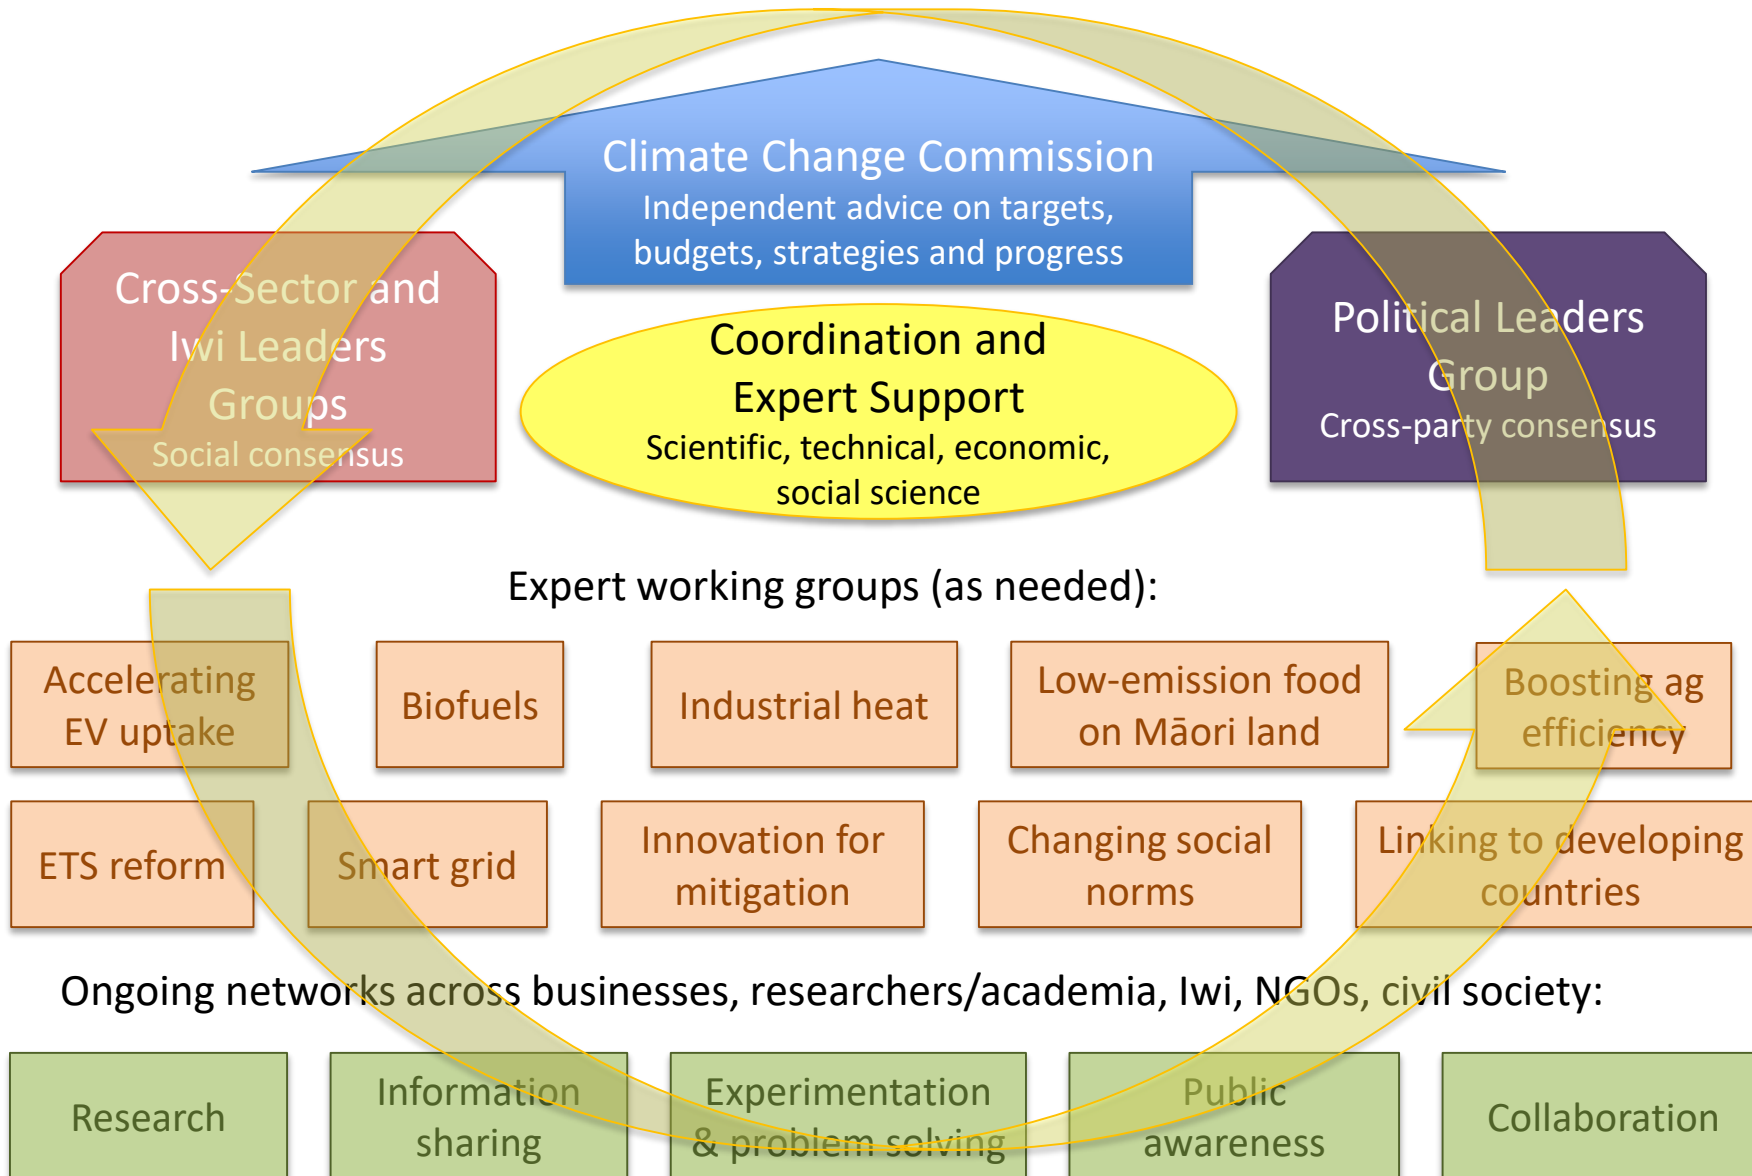

# Flotilla?

# Straw man prototype

# How do we get to low emissions?

Look back from success

- Generates more ideas, and avoids despair

A multitude of actions and actors

We can't predict the path

- Balance creativity and analysis
- Create, maintain and enhance options

Need for broad, stable, social process

- Transparent and trusted
- Well-informed
- Wide range of perspectives

**Through focused intent  
Even small countries can be  
Forces for great change**
